

Apache Tomcat Directories

You'll see the following directories under this apache-tomcat directory.

bin – This contains all the binary files and shell scripts required to start the tomcat, set the environment variables, etc.

conf – This is the tomcat configuration directory where all the config files are located. The main tomcat server config file is **server.xml** which is located under this directory.

lib – Contains library files and classes that are required for the tomcat server

logs – Contains the log and output files of tomcat (**i.e catalina.out, etc.**)

webapps – This is where you'll deploy your java web application. Any application deployed under this directory will be automatically loaded by the Apache tomcat. For example, you can deploy birt-viewer on tomcat.

work – This is used as a temp working directory for your web apps.

temp – This is used by the **JVM**, which will create any required temp files that are specified by java.io.tmpdir.
