

Change Tomcat Default Port

Edit **server.xml** file located under conf directory of tomcat installation.

\$ vi [TOMCAT INSTALL DIR]/conf/server.xml

Find the below content in configuration file

```
<Connector port="8080" protocol="HTTP/1.1"  
            connectionTimeout="20000"  
            redirectPort="8443" />
```

Replace port 8080 with your required port. For example we are changing the default tomcat port with 8081.

```
<Connector port="8081" protocol="HTTP/1.1"  
            connectionTimeout="20000"  
            redirectPort="8443" />
```

After making above changes restart tomcat service. You will see that now tomcat is started on **port 8081** or port you configured. Access tomcat on new port in web browser.
